

Ceramic dental implants Swiss Dental Solutions

CENTER HOČEVAR 

Certified specialists for:

SDS SWISS DENTAL
SOLUTIONS 

Ceramic dental implants are an innovative, modern and biocompatible option for replacing teeth. An implant is a screw that is inserted into the jaw bone with a minor surgical procedure and serves as a replacement for the tooth root. After a few months, the implant is firmly attached to the bone and gum. We say that the implant is integrated. Then, a new all-ceramic dental crown is placed on the implant, as on an artificial root, which is made by a dental technician based on the scan.

The increasing use of ceramic dental implants is the result of increased awareness of a healthy lifestyle and the findings that metal in the mouth can cause certain health problems. In our Centre, we have made great contributions in this regards, and we are constantly raising awareness among patients about the advantages of ceramic implants.

Implants from SDS – Swiss Dental Solutions – are an excellent choice, as SDS is a leading company in the field of ceramic implants. It is a family company, and its beginnings date back to 2000. Their main focus is on the development of ceramics, which are constantly improved and clinically tested in collaboration with numerous clinics and universities. They also have the largest range of different shapes of ceramic implants, which can be used to solve just about any situation.

AESTHETIC SOLUTION

Ceramic dental implants from Swiss Dental Solutions have a natural white colour. An aesthetic solution for a beautiful smile.

BIOCOMPATIBILITY AND HEALTH CARE

Ceramic dental implants from Swiss Dental Solutions integrate well and firmly into the bone, and the gums attach to them, too. The reason for this are biocompatible metal-free ceramics, which are electronically neutral, without surface tension, friendly to the body, and not causing allergies. Metal in the oral cavity can in fact have a negative effect on the entire organism.

Shorter duration of treatment

IMMEDIATE IMPLANTATION

Ceramic dental implants from Swiss Dental Solutions and the unique insertion system are designed to allow the tooth removal (extraction) and the insertion of a ceramic dental implant in a single procedure (immediate implantation).

Aesthetics and strength

NO DARK EDGES

Because of the light colour of ceramic dental implants from Swiss Dental Solutions, there is no fear of annoying grey, dark edges that could be noticeable through the gums when smiling, as it happens with titanium implants. In addition to their beautiful, white colour, ceramic implants are also extremely strong, as they have a very high flexible strength.

PERMANENT SOLUTION

It is a long-term solution without inflammation. Because of its properties, ceramics are more friendly to soft periodontal tissues. Ceramic implants are less prone to plaque build-up than natural teeth.

Less or even no pain

PREPARATION FOR PROCEDURE AND SUPPORTIVE THERAPIES

The ceramic implant implantation procedure is painless, while recovery is almost pain-free, provided patients follow our pre- and post-procedure protocols.

CERTIFIED SPECIALISTS

At the Hočevar Centre, we are certified specialists for inserting ceramic implants from Swiss Dental Solutions.
